A 2012 study, led by a government epidemiologist, found that 4 percent of children lost their diagnosis by age 8. 2 For that study, researchers examined the records of almost 1,400 children who had been diagnosed with autism in four states - Arizona, Georgia, Maryland, and South Carolina - that are part of the U.S. Autism and Developmental Disabilities Monitoring (ADDM) Network. This is believed to be the first population-based study of factors associated with a lost autism diagnosis.
