RF layout. RF layout involves routing the transmission lines from BLE SoC to antenna with few matching components in between. RF transmission lines acts as a medium that carry RF power from a BLE SoC to antenna, hence they need to be routed with many constraints to get maximum RF power delivery to antenna.

It is time to design the antenna. For the monopole, we need to design the ground plane. One way to achieve that is to use 4 radials, drooped at 90 degrees respect to the radiating element, and spaced 90 degrees from each other, in a "star" configuration. The lengths of the radials is the same as the radiating element:  $\lambda/4$  (17.36cm).
