To use buttons and switches with your
Arduino, you have to use a pull-up or pull-
down resistor. `pinMode (pin, INPUT_PULLUP);`
enables the internal pull-up resistors of the
Arduino. `digitalWrite (pin, HIGH);` on an
input pin has the same result. `digitalRead`

This guide is an absolute introduction that assumes the reader has little or no experience with an Arduino. I'm going to explain all the basics of an Arduino and show you how to write your first Arduino program: a variation on the classic "blinking LED" example. Even if you don't have an LED handy, this guide will be useful to you.

Arduino IDE is a special software running on your system that allows you to write sketches (synonym for program in Arduino language) for different Arduino boards. The Arduino programming language is based on a very simple hardware programming language called processing, which is similar to the C language. After the sketch is written in the Arduino IDE, it should be uploaded on the Arduino board for execution. The first step in programming the Arduino board is

To Arduino What Is Arduino? Arduino is an open source programmable circuit board that can be integrated into a wide variety of makerspace projects both simple and complex. This board contains a microcontroller which is able to be programmed to sense and control objects in the physical world. By responding to sensors and inputs, the Arduino is able to interact with a large array of outputs such as LEDs, motors and displays.

This book is good for beginners and for those who already know what is Arduino and how to use it. I read about the benefits and got tips on using Arduino. For example, prepare the left and right "front-rear" legs, they are symmetrical, it is good begin to glue these legs only, making sure that the servomotors are set to the "zero" position.
