108 3 / CALCIUM IN BIOLOGICAL SYSTEMS  $\text{Ca}^{2+}$  ions are also known to play various roles outside cells. In the plant kingdom  $\text{Ca}^{2+}$  ions often form links between individual cells and are required for maintaining the rigidity of whole plants; some seaweeds are typical ex amples. In the blood plasma of mammals, in which the  $\text{Ca}^{2+}$  concentration

Calcium is unique in biological systems.  $\text{Ca}^{2+}$  is the only metal cation demonstrated to function as a secondary messenger in the cytosol of eukaryotes. The information in this pulse of  $\text{Ca}^{2+}$  ions (Berridge 2006) is transduced into a change of conformation of a calcium-modulated protein(s). Many of these calcium-modulated proteins contain two to twelve tandem EF-hand domains.

## *Calcium In Biological Systems Caltech Authors*

Calcium ions ( $\text{Ca}^{2+}$ ) contribute to the physiology and biochemistry of organisms cell. They play an important role in signal transduction pathways, where they act as a second messenger, in neurotransmitter release from neurons, in contraction of all muscle cell types, and in fertilization. Many enzymes require calcium ions as a cofactor, including several of the coagulation factors.

From cell-division to brain development, biological systems accomplish tasks through self-organization across molecular, cellular and organismal scales. Our goal is to understand how unexplained properties of biological systems, including their mechanical organization and their ability to process information, emerge from collective interactions.

At the center of biological dioxygen transport are transition-metal complexes of iron or copper. To model such systems, chemists have prepared several synthetic oxygen carriers, especially of iron and cobalt porphyrins. In this chapter the structures and properties of biological and nonbiological oxygen carriers are discussed.
