'Makes a substantial contribution to the practical, effective analysis of climate change mitigation options in developing countries.' Development And Cooperation 'The book is an excellent exercise and a good source of detailed information, and a basis for further discussions. Any person interested in this major environmental problem should read it.' International Journal of

Environment and Pollution 'Markandya and Halsnaes' collection is thoughtfully put together and can be recommended to all the practitioners in the fields of climate change and sustainable development.' The Journal of Energy Literature This text argues that the policies pursued by developing countries will be crucial in determining the progress of climate change. Many are industrializing rapidly and the largest, particularly China and India, could have an impact at least as significant as that of the already industrialized economies the reason given by President Bush for taking the US out of the Kyoto Protocol. The future of sustainable development in large

measure depends on developing countries. This book develops a pragmatic framework for evaluating the climate change options faced by each developing country, depending on their individual circumstances. It assesses present methods, suggests how these might be improved, and proposes ways in which social and developmental aspects can be taken into account. Its discussion of the issues and the methods presented contribute to the practical analysis of climate change mitigation options in developing countries. The book should be useful to professionals, governments, international organizations and environmental groups working on climate change

issues; as well as researchers, academics and students in economics, environmental and development studies and international affairs.

issue for everyone in the world, not just academics and policymakers. This book serves its intended audience but also deserves to be more widely read. World Entrepreneurship Society Too often, writings on climate change are placed into two categories: climate-change deniers, and climate-change supporters. What this timely and insightful collection of Mohamed Salih s does, is to problematise the issue; taking the debate to a level where it desperately needs to be; asking the thorny questions of how do the politics and international relations of climate impact upon the most vulnerable; the least-affluent; the dwellers of the majority world. In short, Salih challenges us: How did the

climate change about climatechange. The responses of his contributors are salient, to-thepoint sometimes disturbing but always thought-provoking. Timothy Doyle, Keele University, UK Editing the proceedings of a symposium into a cogent and coherent book is no easy task. This book, a tribute to Professor Opschoor is no exception; with disperse contributions of some highly acclaimed authors covering a wide spectrum of themes. It is a credit to Professor Salih s insight to string them together in the introductory chapter and entice the reader to read on. This book has food for thought on many fronts, reaching far beyond climate change, as did the oeuvre of Hans Opschoor. . . an

instructive read. Paul Vlek, Center for Development Research (ZEF), Bonn, Germany It is difficult, if not impossible, to formulate and implement sustainable policy without first understanding the dynamic relationships between nature, society, economics and technology, and research plays a pivotal role in this regard. Climate Change and Sustainable Development is an important book which deals with these issues in the context of climate change and the changing global context of development. It alerts us to the relationship climate change has with two urgent tasks: poverty reduction and sustainable development, which require efforts that span countries, regions and communities. In this

interdependent world, argue the authors, a shared vision and common effort are vital to sustaining our life support system. It is a must read. Jacqueline Cramer, The Netherlands Minister for Spatial Planning and the Environment This unique book provides cuttingedge knowledge and analyses of the consequences that climate change will have for sustainable development and poverty reduction within the context of global development. Exploring alternative resource management approaches including federal resource management governance, ecosystem services, digital dematerialization, ecological cities, biofuels versus food, and children and climate

change, this innovative volume provides fresh insights on the human condition with regards to the current debates on climate change. The distinguished contributors examine climate change induced processes that present profound challenges to sustainable development and poverty reduction at the local, national and global levels. This groundbreaking study will be a welcome addition for graduate and post-graduate students in development and environmental studies. It will also have great appeal to scientists, policymakers and researchers in these fields

Climate change is a major framing condition for sustainable Page 30/41

development of agriculture and food. Global food production is a major contributor to global greenhouse gas emissions and at the same time it is among the sectors worst affected by climate change. This book brings together a multidisciplinary group of authors exploring the ethical dimensions of climate change and food. Conceptual clarifications provide a necessary basis for putting sustainable development into practice. Adaptation and mitigation demand altering both agricultural and consumption practices. Intensive vs. extensive production is reassessed with regard to animal welfare, efficiency and environmental implications. Property rights pay an ever-increasing role, as do

shifting land-use practices, agroenergy, biotechnology, food policy to green consumerism. And, last but not least, tools are suggested for teaching agricultural and food ethics. Notwithstanding the plurality of ethical analyses and their outcome, it becomes apparent that governance of agri-food is faced by new needs and new approaches of bringing in the value dimension much more explicitly. This book is intended to serve as a stimulating collection that will contribute to debate and reflection on the sustainable future of agriculture and food production in the face of global change.

aspects of initiatives—to check pollution and to reduce consumption of fossil fuels—by the Association of Southeast Asian Nations (ASEAN). The chapters examine climate change projections for ASEAN, the relationship between income inequality and environmental sustainability, greening initiatives pursued by microfinance institutions, farmers' awareness and perceptions of climate change, potential introduction of hydrogen fuel cell vehicles in Malaysia, the impact of Euro-4 automobile emission regulations on the development of technological capabilities and the threats and vulnerability people face from climate change and national disasters. The United

Nations Framework Convention for Climate Change's Conference of Parties meetings to cap temperature rise to 1.5 degrees Celsius over the next century has set the steering and the interventions essential for mitigating global warming. There is increasing recognition that initiatives must be taken across the globe regardless of the state of development of each individual country, and so this book has important practical implications. This book was originally published as a special issue of the Journal of the Asia Pacific Economy.

It builds upon a selection of relevant and practical papers and presentations given at the 2nd International Conference on Evaluating Climate Change and Development held in Washington DC in 2014 and includes perspectives from independent evaluations of the major international organisations Page 35/41

supporting climate action in developing countries, such as the Global Environment Facility. The first section of the book sets the stage and provides an overview of independent evaluations, carried out by multilateral development banks and development organisations. Important topics include how policies and organisations aim to achieve impact and how this is measured, whether climate change is mainstreamed into other development programs, and whether operations are meeting the urgency of climate change challenges. The following sections focus on evaluation of climate change projects and policies as they link to development, from the perspective of international

organisations, NGO's, multilateral and bilateral aid agencies, and academia. The authors share methodologies or approaches used to better understand problems and assess interventions, strategies and policies. They also share challenges encountered, what was done to solve these and lessons learned from evaluations. Collectively, the authors illustrate the importance of evaluation in providing evidence to guide policy change to informed decisionmaking.

The evidence for human-induced climate change is now overwhelming, the brunt of its impacts is already being felt by poor people, and the case for Page 37/41

urgent action is compelling. This book addresses the two greatest challenges of our time - averting catastrophic climate change and eradicating poverty - and the close interconnections between them. Climate Change and Development provides a comprehensive and multidisciplinary foundation for understanding the complex and tangled relationship between development and climate change. It argues that transformational approaches are required in order to reconcile poverty reduction and climate protection and secure sustained prosperity in the twenty first century. Section One provides the building blocks for understanding climate science and the nexus between climate

and development. Section Two outlines responses to climate change from the perspective of developing countries, with chapters on international agreements, climate change mitigation and adaptation, and climate finance. Each chapter offers analytical tools for evaluating responses, enabling readers to ask smart questions about the climate change and development nexus as policy and action evolve in the coming years. The last three chapters of the book, contained in Section Three, are forward looking and focus on why and how development must be re-framed to deliver more equitable and sustainable outcomes. This section sets out different critiques of

'development-as-usual' and explores alternative paradigms of development in a warming and resource-constrained world. This is an invaluable and clearly written text that uses real world examples to bring to life perspectives from across different disciplines. It also contains chapter learning outcomes, and end of chapter summaries, discussion questions, and suggestions for further reading and relevant websites. The text is suitable for both undergraduate and postgraduate students, as well as those working in international development contexts who wish to get to grips with this pressing global challenge.
