The phase unwrapping is performed using segment-wise, block-wise and pixel-wise phase unwrapping algorithms. The errors in phase unwrapping are shown in figures 3.17 (b)–(d), respectively. The effects of segment-wise, block-wise and pixel-wise methods of phase unwrapping are clearly visible in the error maps.

The algorithm has two main steps: 1. Phase unwrapping: we input two (or more) different frequency interferograms (of the same scene), which provides an extension of the [??] ambiguity interval and, consequently, an increasing of the phase rates that still allow unwrapping to be a well-posed problem.

In this paper, we present a noniterative simultaneous phase unwrapping and denoising algorithm for phase imaging, referred to as SPUD. The proposed method relies on the least squares discrete cosine transform (DCT) solution for phase unwrapping with an additional sparsity constraint on the DCT coefficients of the unwrapped solution.

However, the phase distribution is computed as modulo 2π of the absolute phase due to inverse tangent operation, which makes the phase unwrapping indispensable. the reliability of phase unwrapping depends heavily on the quality of the phase pattern. Abstract: In the traditional processing flow of interferometric synthetic aperture radar (SAR) technique, the processing of phase is conducted via two separated and successive steps, i.e., phase denoising and phase unwrapping. That is to say, first, wrapped phases without noise are generated, and then, the true phases without 2π -ambiguities are reconstructed (here and in the rest of this paper, true phase refers to the information-induced unwrapped phase without noise).

Phase unwrapping is thus needed to reconstruct the true phase from the wrapped phase. However, noise in a wrapped phase is an obstacle for successful phase unwrapping, especially when a simple phase unwrapping method is used [2,3], and thus denoising is necessary.

Abstract. The phase of an image obtained with many magnetic resonance imaging techniques is related to some physical variable of interest. This phase needs to be unwrapped, which is complicated by the presence of noise and multiple objects of irregular shape. A new two-dimensional phase unwrapping algorithm is presented, along with simulation results. © 1992 Academic Press, Inc.
