## Design For Test For Digital

Design for testing or design for testability consists of IC design techniques that add testability features to a hardware product design. The added features make it easier to develop and apply manufacturing tests to the designed hardware. The purpose of manufacturing tests is to validate that the product hardware contains no manufacturing defects that could adversely affect the product's correct functioning. Tests are applied at several steps in the hardware manufacturing flow and, for certain p

- Testability in Design.
- Build a number of test and debug features at design time
- This can include “ debug-friendly ” layout.
  - For wirebond parts, isolate important nodes near the top
  - For face-down/C4 parts, isolate important node diffusions.
- This can also include special circuit modifications or additions.

On some devices TAP pins can be configured to have functions other than 1149.x boundary scan so it is important to ensure that the design does not prevent devices being used for JTAG testing. The function of these pins is normally configured by sampling other pins on the device as it is reset.

Design for Test Design the chip to increase observability and controllability If each register could be observed and controlled, test problem reduces to testing combinational logic between registers. Better yet, logic blocks could enter test mode where they generate test patterns and report the results automatically.

Test design is a significant step in the Software Development Life Cycle (SDLC), also known as creating test suites or testing a program. In other words, its primary purpose is to create a set of inputs that can provide a set of expected outputs, to address these concerns: What to test and what not to test
