diffuse lung diseases clinical features pathology hrct

Interstitial lung disease, or diffuse parenchymal lung disease, is a group of lung diseases affecting the interstitium (the tissue and space around the alveoli (air sacs of the lungs). It concerns alveolar epithelium, pulmonary capillary endothelium, basement membrane, and perivascular and perilymphatic tissues. It may occur when an injury to the lungs triggers an abnormal healing response. Ordinarily, the body generates just the right amount of tissue to repair damage, but in interstitial lung

Interstitial lung disease - Wikipedia

This patient had been engaged in the manufacture and repair of futons for 50 years, during which period he had been exposed to cotton dust without respiratory protection. The futon is a traditional Japanese style of bedding made of cotton packed inside a cloth bag, and is similar to the mattress used on a western bed.

Diffuse lung disease caused by cotton fibre inhalation but ...

Clinical signs include clubbing, subcostal retractions, chest wall deformity including either pectus excavatum (such as with surfactant disorders), or pectus carinatum (more typical in airway disorders associated with air-trapping such as NEHI and bronchiolitis obliterans), and hypoxaemia.

Children's interstitial and diffuse lung disease

For diffuse lung diseases with an obvious etiology (eg, occupational lung disease or infective pneumonias), a classification scheme is simple enough but does not accommodate idiopathic diseases. ... Cryptogenic fibrosing alveolitis: clinical features and their influence on survival.
