This book helps people find sensitive information on the Web. Google is one of the 5 most popular sites on the internet with more than 380 million unique users per month (Nielsen/NetRatings 8/05). But, Google's search capabilities are so powerful, they sometimes discover content that no one ever intended to be publicly available on the Web including: social security numbers, credit card numbers, trade secrets, and federally classified documents. Google Hacking for Penetration Testers Volume 2 shows the art of manipulating Google used by security professionals and system administrators to find this sensitive information and "self-police their own organizations. Readers will learn how Google Maps and Google Earth provide pinpoint military accuracy, see how bad guys can manipulate Google to create super worms, and see how they can "mash up" Google with MySpace, LinkedIn, and more for passive reconnaissance. • Learn Google Searching Basics Explore Google's Web-based Interface, build Google queries, and work with Google URIs. • Use Advanced Operators to Perform Advanced Queries Combine advanced operators and learn about colliding operators and bad search-fu. • Learn the Ways of the Google Hacker See how to use caches for anonymity and review directory listings and traversal techniques. • Review Document Grinding and Database Digging See the ways to use Google to locate documents and then search within the documents to locate information. • Understand Google's Part in an Information Collection Framework Learn the principles of automating searches and the applications of data mining. • Locate Exploits and Finding Targets Locate exploit code and then vulnerable targets. • See Ten Simple Security Searches Learn a few searches that give good results just about every time and are good for a security assessment. • Track Down Web Servers Locate and profile web servers, login portals, network hardware and utilities. • See How Bad Guys Troll for Data Find ways to search for usernames, passwords, credit card numbers, social security numbers, and other juicy information. • Hack Google Services Learn more about the AJAX Search API, Calendar, Blogger, Blog Search, and more.

This book demystifies the models we use to simulate present and future climates, allowing readers to better understand how to use climate model results. In order to predict the future trajectory of the Earth's climate, climate-system simulation models are necessary. When and how do we trust climate model predictions? The book offers a framework for answering this question. It provides readers with a basic primer on climate and climate change, and offers non-technical explanations for how climate models are constructed, why they are uncertain, and what level of confidence we should place in them. It presents current results and the key uncertainties concerning them. Uncertainty is not a weakness but understanding uncertainty is a strength and a key part of using any model, including climate models. Case studies of how climate model output has been used and how it might be used in the future are provided. The ultimate goal of this book is to promote a better understanding of the structure and uncertainties of climate models among users, including scientists, engineers and policymakers.

From A to Z, top to bottom and left to right. Poems, ramblings and pieces, written from experience and imagination. Real life witnessed through the eyes of one person, one writer, one soul. Memories that were forgotten, broken relationships of the past and true love of the present and future. Misguided steps taken through the hard and dark times and shots of strength both large and small. Off the wall creations of fiction inside unreal worlds of fantasy and horrors hidden within frightful darkness. Fragments of humor peppered with a mix of light and dark undertones. From 2 to A, bottom to top and right to left. Pieces, ramblings and poems. Cover to cover, there's never a dull moment.

The papers address topics ranging from novel memory architectures to emerging application design and performance analysis and encompassed the following workshops: AMMS-BT, 3rd workshop on architectural and micro-architectural support for binary translation; EMMA, the 3rd Workshop for emerging applications and many-core architectures; WREP, 2nd Workshop on energy efficient design, as well as WIOSCA, the annual workshop on the interaction between operating systems and computer architecture.

From the authors of the bestselling Hack Proofing Your Network! OPEC, Amazon, Yahoo! and E-bay! If these large, well-established and security-conscious web sites have problems, how can anyone be safe? How can anyone be secure? Hack Proofing Your Web Applications is the only book specifically written for application developers and webmasters who write programs that are used on web sites. It covers Java applications, XML, Colusion, and other database applications. Most hacking books focus on catching the hackers once they've entered the site; this one shows programmers how to design tight code that will deter hackers from the word go. Comes with up-to-the-minute web based support and a CD-ROM containing source codes and sample testing programs Unique approach: Unlike most hacking books this one is written for the application developer to help them build less vulnerable programs

Johnny Long's last book sold 12,000 units worldwide, Kevin Mitnick's last book sold 40,000 units in North America. As the clich  goes, information is power. In this age of technology, an increasing majority of the world's information is stored electronically. It makes sense then that we rely on high-tech electronic protection systems to guard that information. As professional hackers, Johnny Long and Kevin Mitnick get paid to uncover weaknesses in those systems and exploit them. Whether breaking into buildings or slipping past industrial-grade firewalls, their goal has always been the same: extract the information using any means necessary. After hundreds of jobs, they have discovered the secrets to bypassing even conceivable high-tech security system. This book reveals those secrets: as the title suggests, it has nothing to do with high technology. • Dumpster Diving Be a good sport and don't read the two "D" words written in big bold letters above, and act surprised when I tell you hackers can accomplish this without relying on a single bit of technology (punny). • Tailgating Hackers and ninja both like wearing black, and they do share the ability to slip inside a building and blend with the shadows. • Shoulder Surfing If you like having a screen on your laptop so you can see what you're working on, don't read this chapter. • Physical Security locks are serious business and look technicians are true engineers, most backed with years of hands-on experience. But what happens when you take the age-old respected profession of the locksmith and sprinkle it with hacker ingenuity? • Social Engineering with Jack Wiles Jack has trained hundreds of federal agents, corporate attorneys, CEOs and internal auditors on computer crime and security-related topics. His unforgettable presentations are filled with three decades of personal "war stories" from the trenches of Information Security and Physical Security. • Google Hacking A hacker doesn't even need his own computer to do the necessary research. If he can make it to a public library, Kinko's or Internet cafe, he can use Google to process all that data into something useful. • P2P Hacking Let's assume a guy has no budget, no commercial hacking software, no support from organized crime and no fancy gear. With all those restrictions, is this guy still a threat to you? Have a look at this chapter and judge for yourself. • People Watching Skilled people watchers can learn a whole lot in just a few quick glances. In this chapter we'll take a look at a few examples of the types of things that draws a no-tech hacker's eye. • Kiosks What happens when a kiosk is more than a kiosk? What happens when the kiosk holds airline passenger information? What if the kiosk holds confidential patient information? What if the kiosk holds cash? • Vehicle Surveillance Most people don't realize that some of the most thrilling vehicular espionage happens when the cars aren't moving at all!

Build a disruptive marketing agency for the modern age The marketing services industry is on the cusp of a truly transformational period. The old guard, rooted in tradition and resistant to change, will fall and new leaders will emerge. Hybrid marketing agencies that are more nimble, tech savvy, and collaborative will redefine the industry. Digital services will be engrained into the DNA and blended with traditional methods for integrated campaigns. The depth, versatility, and drive of their talent will be the cornerstones of organizations that pursue a higher purpose. The Marketing Agency Blueprint is a practical and candid guide that presents ten rules for building such a hybrid agency. The new marketing agency model will create and nurture diverse recurring revenue streams through a mix of services, consulting, training, education, publishing, and software sales. It will use efficiency and productivity, not billable hours, as the essential drivers of profitability. Its value and success will be measured by outcomes, not outputs. Its strength and stability will depend on a willingness to be in a perpetual state of change, and an ability to execute and adapt faster than competitors. The Marketing Agency Blueprint demonstrates how to: Generate more qualified leads, win clients with set pricing and service packages, and secure more long-term retainers Develop highly efficient management systems and more effective account teams Deliver greater results and value to clients This is the future of the marketing services industry. A future defined and led by underdogs and innovators. You have the opportunity to be at the forefront of the transformation.
