Introduction To Internal Combustion Engine**

An internal combustion engine (ICE) is a heat engine in which the combustion of a fuel occurs with an oxidizer (usually air) in a combustion chamber that is an integral part of the working fluid flow circuit. In an internal combustion engine, the expansion of the high-temperature and high-pressure gases produced by combustion applies direct force to some component of the engine.

An Internal Combustion Engine is an engine in which the combustion of fuel occurs inside a chamber in contrast to the steam engines where combustion occurs outside the engine. Internal combustion engines are fueled by gasoline, diesel, hydrogen, methane, propane, etc. Internal Combustion Engine produces high temperature and pressure gases whose expansion applies force to a component inside the chamber. This force is applied typically to pistons, turbine blades, or a nozzle.
