The magnifying transmitter was an adaptation of the Tesla coil. Instead of being designed to discharge to the earth the magnifying transmitter tuned to the natural resonant circuit of the Earth to create standing waves of electrical energy, which could be harnessed by a tuned receiving circuit. A magnifying transmitter is basically between the grounding and the base of the coil. In the late 1890s, Tesla had turned out to be fixated on moving force without wires. He felt that it was conceivable to do it at a higher height. Subsequent to verifying some funding's, He set up a lab in Colorado Springs in May 1899.

Nikola Tesla: Magnifying Transmitter - Want To Know

The Magnifying Transmitter by Nikola Tesla : "...It is a resonant transformer with a secondary in which the parts charged to a high potential, are of considerable area and arranged in space along ideal enveloping surfaces of very large radii of curvature, and at proper distances from one another thereby insuring a small electrical surface density everywhere so that no leak can occur even if the conductor is bare.

Wardenclyffe Tower (1901-1917), also known as the Tesla Tower, was an early experimental wireless transmission station designed and built by Nikola Tesla on Long Island in 1901-1902, located in the village of Shoreham, New York. Tesla intended to transmit messages, telephony and even facsimile images across the Atlantic to England and to ships at sea based on his theories of using the Earth ...

A Tesla coil is an electrical resonant transformer circuit designed by inventor Nikola Tesla in 1891. It is used to produce high- voltage, low- current, high frequency alternating-current electricity. Tesla experimented with a number of different configurations consisting of two, or sometimes three, coupled resonant electric circuits.
