qammod

ca = sin(c) .* (symsI/50);cb = cos(c) .* (symsQ/50); We

implement our phase shifting by passing the carrier vector

cthrough either sinor cos. Additionally, we apply some

attenuation to our analogue signals to prevent them from

making our carrier too large - we'll do the inverse during the

demodulation.

The symbols are transmitted using Quadrature Phase Shift Keying (QPSK) 4-QAM. Simulated BER is calculated using ML detection scheme. Theoretical expression is $2 * p - p^2$, where p is BER for BPSK modulation

`z = qamdemod (y,M,symOrder)` returns a demodulated signal, `z`, and specifies the symbol order for the demodulation. `z = qamdemod (____,Name,Value)` specifies options using one or more name-value pair arguments. For example, 'OutputType','bit' sets the type of output signal to bits.

M-ary Quadrature Amplitude Modulation

The procedure is called quadrature amplitude modulation, QAM abbreviated because the sum pointer can be separated into two perpendicular components. The method described herein is the analog QAM, for example, comes in the analog color television engineering. There, the two color difference signals (B-Y) and (R-Y) amplitude modulate the same ...

An OFDM carrier signal is the sum of a number of orthogonal subcarriers, with baseband data on each subcarrier being independently modulated commonly using some type of quadrature amplitude modulation (QAM) or phase-shift keying (PSK). This composite baseband signal is typically used to modulate a main RF carrier.

Orthogonal frequency-division multiplexing - Wikipedia

A quadrature amplitude modulation (QAM) system is a communication system capable of transmitting two messages $m_1(t)$, $m_2(t)$ at the same time. The transmitted signal $s(t)$ is. $s(t) = m_1(t) \cos(\omega_c t) + m_2(t) \sin(\omega_c t)$ Carefully draw a block diagram for the QAM system.

Quadrature Amplitude Modulation - an overview ...

Quadrature amplitude modulation (QAM) is the name of a family of digital modulation methods and a related family of analog modulation methods widely used in modern telecommunications to transmit information. It conveys two analog message signals, or two digital bit streams, by changing (modulating) the amplitudes of two carrier waves, using the amplitude-shift keying (ASK) digital modulation ...
