A radio-frequency microelectromechanical system is a microelectromechanical system with electronic components comprising moving sub-millimeter-sized parts that provide radio-frequency functionality. RF functionality can be implemented using a variety of RF technologies. Besides RF MEMS technology, III-V compound semiconductor, ferrite, ferroelectric, silicon-based semiconductor, and vacuum tube technology are available to the RF designer. Each of the RF technologies offers a distinct trade-off b

Radio frequency micro electromechanical systems (RF MEMS) are an enabling technology for a new generation of intelligent antennas with the capability of dynamically self-adapting their properties in order to maintain performance under operational or environmental variations.

RF MEMS antennas for wireless applications - ScienceDirect

The MEMS acronym stands for Micro-Electromechanical System and is used to refer to components of which sub-millimeter-sized parts need to move for the components to have electronic functionality. RF MEMS passives, such as capacitors, inductors, resonators and switches, offer low loss, high Q factor, high linearity and good power handling.
