can be written as  $X_{n+1} (1+r)^{n+1} = X_n (1+r)^n + \Delta S_{n+1} (1+r)^{n+1} - S_n (1+r)^n$  This leads to a representation by discrete stochastic integral:  $X_e^T = X_0 + \int_0^T \Delta S_e$ ; where  $X_e^n = X_n (1+r)^n$  and  $\Delta S_e^n = S_n (1+r)^n - S_{n-1} (1+r)^{n-1}$ ,  $n=1,2,\dots,N$ . Explain intuitively why, if you are told that  $X = 1$ , you would want to revise your estimate of the distribution of  $S_1$ . Solution. We first note that under  $P$ ,  $X$  and  $S_1$  are dependent (as shown in part d) above). In fact, a simple calculation shows that  $P(S_1$

A stochastic differential equation (SDE) is a differential equation in which one or more of the terms is a stochastic process, resulting in a solution which is also a stochastic process. SDEs are used to model various phenomena such as unstable stock prices or physical systems subject to thermal fluctuations. Typically, SDEs contain a
