~~TUBE TO TUBESHEET JOINTS: THE MANY CHOICES ABSTRACT~~

Design engineers have basically two weld options for a tube-to-tubesheet joint: 1) roll or expand (with grooves milled in tube holes) and seal welded, or, 2) strength welds (no grooves required). Each type of joint has advantages and disadvantages; regardless of which type you choose, it's crucial to use a welding technique that achieves consistent quality.

One of the most important steps in the mechanical design process is determining the method of attachment for the tube-to-tubesheet joint. Many of the problems which have been experienced with zirconium shell and tube heat exchangers could have been avoided by giving more attention to the selection and design of the tube-to-tubesheet joint.

The main function of tube-to-tubesheet joint is to seal the tubes tightly to the tubesheet, and for some exchangers, an additional function is to support the tubesheet against pressure induced load. Tubes are sealed inside the tubesheet by the following methods. □ Expanding tube inside tubehole □ Welding tubes to tubesheet

narrow gap would ensure proper welding of the groove between the tube and tubesheet.

Subsequent weld runs between the tube and the tubesheet made the size of the weld close to strength weld with a maximum leak-path.

Tube to tube sheet joint shall be examined during hydro test to detect leakage, if any. In the event of leakage, the tube shall be re - expanded. Care shall be taken to ensure that there is no excessive thinning of the tubes. This is all about procedure for Expansion Joints.

To ensure leak tightness, the author suggests using seal- or strength-welding followed by expanding tube-to-tubesheet joints. For welded-and-expanded joints, the author further recommends welding and expanding criteria and nondestructive examinations.

A very common question arises while deciding the sequence of welding and expansion of Tube to Tubesheet Joint. The preferred and the recommended sequence is welding before expansion: The reasons as mentioned below;

Failure analysis was carried out on a tube-to-tubesheet welded joint of a shell-tube heat exchanger to confirm its failure mechanism. The collected evidence suggests that the failure of the tube-to-tubesheet welded joint was induced by fatigue. Under the morphology analysis, the fracture surface exhibit obvious fatigue crack propagation traces.

It has to be decided whether to go for expansion joint, seal weld or strength weld or combination of strength weld and expansion.

There are four types of tube-to-tubesheet joints: 1. Roll or expand only (without grooves) - strength is poor. - leak resistance is poor. - tube replacement is very easy. - application is limited (i.e. low pressure water or air) 2. Roll or expand only (with grooves)

Explosive Expansion. Almost all
explosive expanding is done on
constructions where the primary
seal of the tube to the tubesheet
is by welding. Explosive
expansion has been successfully
applied to expand tubes into
tubesheets as thin as 1 1/2" and
as thick as 33".

~~TUBE EXPANSION ISSUES AND METHODS~~

The design consists of an array of
tubes, which is connected on
each side to a flat plate called a
tubesheet. The tubesheet also
separates the shell and tube sides
